

THE NATURE'S SAVAGE REVENGE

The recent tsunami that washed away some cities in Japan proved Mother Nature's savage revenge over human's exploit against her. The present humans' indifferent response on the drastic environmental dilemma must seriously cease and begin the awareness on how such problem can be possibly alleviated.

Over the years, we just gave our most indifferent shrug regarding the expected retaliation of Mother Nature as humans incessantly abused her abundance. Some even laughed it out saying that the predicted environmental crisis was too distorted to cause havoc to the entire humanity.

Yet, with what has been happening to some specific places in the world, many abrupt changes have begun to persist. Ice caps are melting, sea level is dramatically increasing, unpredictable climate changes, consistent earthquakes followed by gigantic tsunami, what else do we really have to wait before we all make a move?

While many governments as well as concerned associations all over the world have been making essential actions on educating the people about this worsening scenario, it seems that nothing humans can do will ever stop Mother Nature from pursuing its plan of destroying what man ignored.

With the catastrophe Japan experienced, I believe that we, humans, have gradually opened our eyes and despondently accepted that indeed, nature is at work.

But, the main question is: "Can humans ever stop this environmental crisis?" Many reporters and scientists made conclusions that the problem is too global that any of man's proposed solutions can never fix it. What we can do is only to lessen the damages so that the future generations can still and somehow enjoy the beauty that Mother Nature has left to offer.

It is so disheartening to ponder what massive loss we have had and will have once nature gives up on us. Is there any use of regretting what man has done? I believe we have to continue holding on to the little hope we have of saving Mother Earth or we will lose the only planet known to mankind.
